Designing with Greenery

Bringing architectural spaces to life with greenery

Plants transform interior spaces. They soften architecture, improve wellbeing, and create environments people enjoy spending time in.

For over 40 years, Green Design has worked alongside architects, designers and developers to integrate greenery into workplaces, hospitality spaces and commercial buildings. From simple planter installations to large-scale green walls, our team designs, installs and maintains interior planting, helping bring greenery into the built environment in a way that is both visually impactful and practical to care for over time.

Indoor Planting Expertise

Green Design works with long-term specialist growers to source a wide selection of premium indoor plants suited to commercial environments. Our range includes feature trees and statement plants, architectural foliage, tropical planting schemes, low-light plants suited to office environments, as well as native and specialty species.

Successful interior planting requires more than simply choosing attractive plants. It requires a strong understanding of how plants perform indoors over time. With over 40 years of experience, our team carefully selects plant species based on factors such as natural and artificial light levels, maintenance requirements, plant performance and the overall sustainability of the planting scheme. We also consider how plants will complement the surrounding architecture and interior design of the space.

Once installed, our technicians provide ongoing plant care and maintenance to ensure installations remain healthy, visually striking and sustainable over the long term. Our team can also assist during the design stage with plant selection, layouts and planting concepts that feel at home within the built environment.

Sustainable Planters

Green Design offers one of the largest ranges of planters available for commercial interiors, giving designers the flexibility to achieve exactly the right look.

Crafted from sustainable and recycled materials, including plastics and reclaimed fishing nets, our planters reduce environmental impact without compromising on quality or finish.

Designed to complement each space, these planters can be customised with options including tailored colours to match interior palettes, a wide range of heights and sizes, and various shapes such as cylindrical, square and trough designs.

They are also made to integrate with Green Design's sub-irrigation system, allowing plants to draw water from below the root zone. This helps maintain consistent moisture levels, supporting healthier plants while reducing watering requirements.

Because of the breadth of our range and our ability to customise, almost any design outcome is possible, from subtle, understated planters to large statement pieces that become part of the architecture of the space.

Our team regularly works with architects and designers to ensure planter selections feel like a considered part of the interior, not an afterthought.

Living Green Walls

Living green walls create striking vertical gardens that bring large-scale greenery into interior spaces. They transform blank walls into vibrant features, adding depth, texture and natural life to workplaces, hospitality venues and public environments.

Green Design has delivered green wall installations across a wide range of commercial projects, working closely with architects, designers and builders to integrate living walls into the architecture of the space.

We are also the Australian distributor of the NextGen Living Wall system, a modular vertical garden system designed specifically for commercial environments, offering a flexible and reliable solution for integrating living greenery into commercial projects of any scale.

With the right design and ongoing care, a living green wall becomes a lasting architectural feature in its own right, one that brings the measurable benefits of greenery into the spaces people occupy every day.

Moss Walls

Moss walls provide the visual impact of greenery without the need for watering, irrigation or ongoing maintenance. Using natural preserved moss, they offer a simple and effective way to introduce texture and greenery into interior spaces while remaining perfectly suited to commercial environments.

Green Design has been a pioneer of moss wall installations in Australia for over a decade, delivering feature moss walls for commercial offices, hospitality venues and public spaces.

Moss walls are commonly used to create striking feature walls in reception areas, meeting spaces and breakout areas where a strong visual statement is desired without the demands of live planting.

They can be designed in a range of formats, from framed moss artwork to large custom installations and branded feature walls.

Because the moss is naturally preserved, it retains its appearance for many years, a genuinely set-and-forget solution for interior spaces.

Joinery Planting

Integrating plants into custom joinery requires careful planning and specialist knowledge. Green Design has extensive experience working with builders, architects, designers and fit-out companies to incorporate planting into joinery elements such as cabinets, benches and built-in planter boxes, ensuring the best outcome for the client.

We enjoy collaborating during the design stage to help ensure joinery planter boxes are designed correctly from the outset. Our team integrates our sub-irrigation system into custom joinery, allowing plants to draw water from below the root zone, helping maintain consistent moisture levels while reducing the risk of overwatering.

We also manufacture custom mulch plates that sit neatly within joinery planters, creating a clean finish while protecting the planting system beneath. Combined with careful plant selection suited to interior conditions, this ensures installations remain both visually refined and reliable over time.

By considering drainage, moisture control, plant health and maintenance access from the beginning, Green Design ensures joinery planting is not only visually striking, but also practical and safe for the surrounding joinery and interior finishes.

In-House Construction & Custom Design

At Green Design, we understand that many projects require solutions beyond standard planter systems. That's why we have our own in-house construction team and in-house paint studio, allowing us to design and manufacture custom elements to suit the specific needs of each project.

This capability allows us to work closely with architects, designers and builders to create solutions that integrate seamlessly with joinery, furniture and architectural features. From custom mulch plates for joinery planters to bespoke planters finished in colours to match interior palettes, our team can produce solutions tailored to the space.

We also design and construct custom vertical garden structures, including framed green walls, vertical garden frames and even mobile green wall installations built specifically for the spaces they'll inhabit.

Having these capabilities in-house allows us to deliver flexible, practical solutions for complex projects. When it comes to integrating greenery into interior spaces, if you can design it, we can build it.

Our Approach

Green Design approaches each project with a clear process, from early planning through to installation and ongoing maintenance. We assist with plant selection, planter systems and irrigation solutions to ensure the planting suits the space and performs well over time. By considering factors such as light levels, maintenance requirements and long-term plant health, we help deliver installations that are both visually striking and reliable in commercial environments.

01

Concept

We assist with planting ideas, planter placement and suitable plant selection for the space.

02

Design

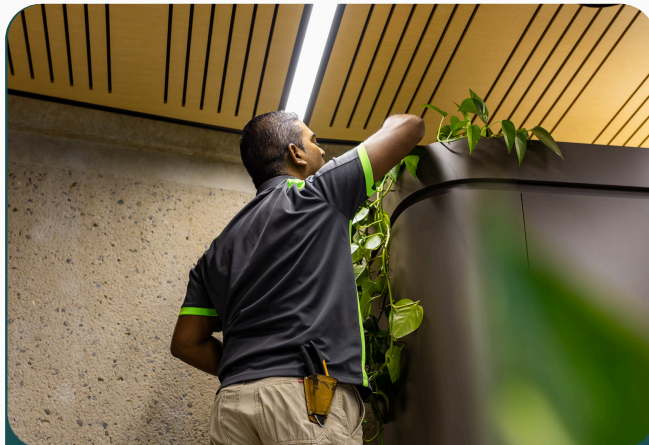

We refine the planting scheme and confirm the appropriate plants and planters.

03

Installation

Our team installs the plants and systems on site.

04

Maintenance

Our technicians provide regular care to ensure the plants remain healthy and look their best.

Innovation & Sustainability

Innovation and sustainability are core to how Green Design operates. Over the years we have continually looked for ways to improve the efficiency, performance and environmental impact of interior planting in commercial environments.

This includes the development and use of our sub-irrigation planting system, which helps reduce water use while supporting healthier plants and reducing maintenance requirements.

Across our operations we have also invested in initiatives such as solar panels, electric and hybrid vehicles within our fleet, and improvements to reduce energy consumption within our facilities.

Our efforts have been recognised within the industry, with Green Design receiving the Interior Plantscape Association Sustainability Award for three consecutive years, as well as international recognition through the International Plantscape Awards.

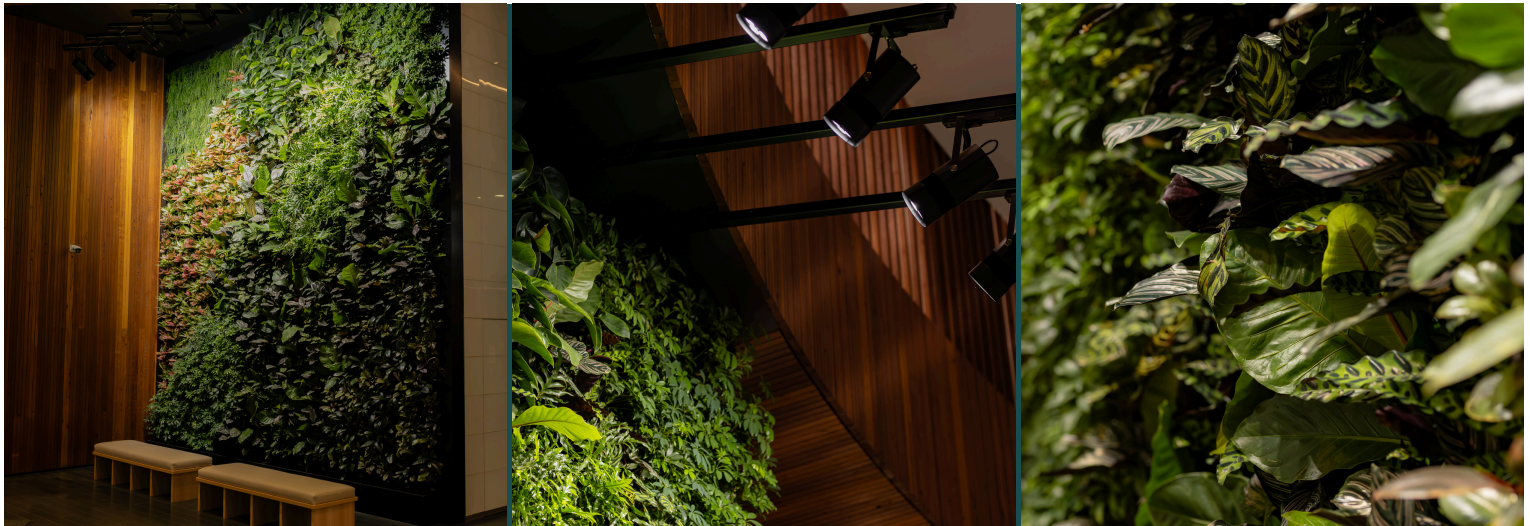

These initiatives reflect a genuine commitment to doing things better for clients, for buildings, and most importantly for the environment.

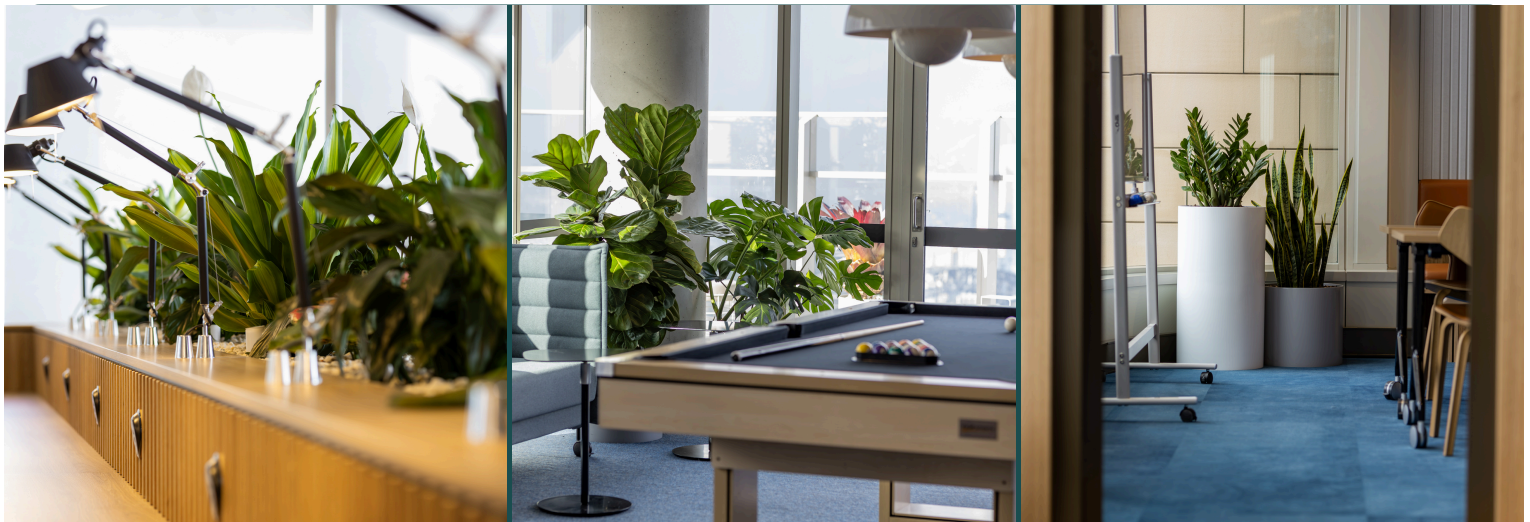

Some Recent Projects

Jones Lang LaSalle

Piccadilly Tower

AirTrunk

Green Design Indoor Plant Hire

Green Design delivers interior planting installations for commercial spaces across Australia, including offices, hospitality venues and public environments.

Our work ranges from simple planter installations through to green walls, moss walls and custom planting solutions designed to integrate with the architecture and interior design of a space.

With a strong focus on plant performance, quality installations and long-term maintenance, we help ensure interior greenery remains healthy, visually stunning and practical to manage.

Let's Talk

If you're working on a project where greenery could play a role, we'd love to be involved early.
